47 CFR FCC Part 15.255

The product was received on Jul. 13, 2018, and testing was started from Jul. 28, 2018 and completed on Aug. 30, 2018. We, SPORTON INTERNATIONAL INC. EMC & Wireless Communications Laboratory, would like to declare that the tested sample has been evaluated in accordance with the procedures given in ANSI C63.10-2013, 47 CFR FCC Part 15.255, Millimeter Wave Test Procedures and shown compliance with the applicable technical standards.

The report must not be used by the client to claim product certification, approval, or endorsement by TAF or any agency of government.

The test results in this report apply exclusively to the tested model / sample. Without written approval of SPORTON INTERNATIONAL INC. EMC & Wireless Communications Laboratory, the test report shall not be reproduced except in full.

1.5 EUT Operation during Test

For CTX Mode:

For Transmitter Spurious Emissions above 1GHz test:

Use the notebook to make EUT continuously transmit RF signal continuously and remove the notebook.

For other tests:

During the test, executed the test program to control the EUT continuously transmit RF signal.

For Normal Link:

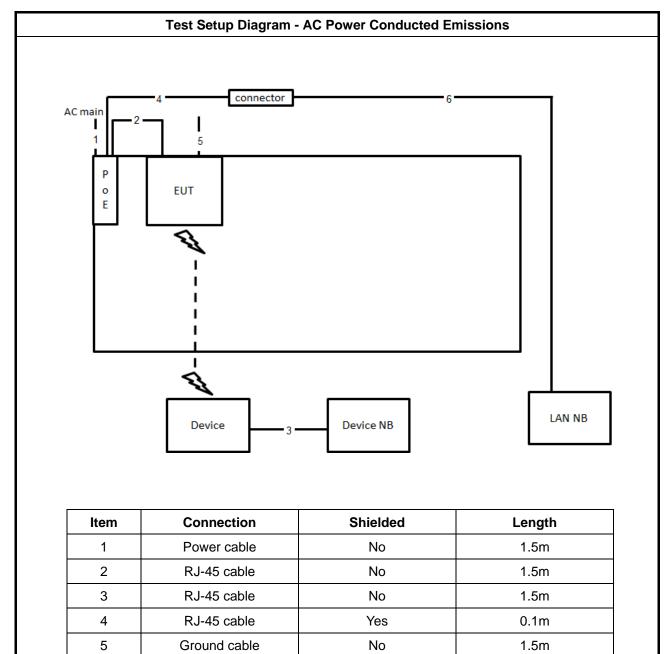

During the test, the EUT operation to normal function.

| AC Power Conducted Emissions | Normal Link |
| Occupied Bandwidth | 58.32, 60.48, 62.64, 64.80 |
| EIRP Power | 58.32, 60.48, 62.64, 64.80 |
| Peak Conducted Power | 58.32, 60.48, 62.64, 64.80 |
| Transmitter Spurious Emissions (below 1 GHz) | Normal Link |
| Transmitter Spurious Emissions (1 GHz-40 GHz) | 58.32, 60.48, 62.64, 64.80 |
| Transmitter Spurious Emissions (above 40 GHz) | 58.32, 60.48, 62.64, 64.80 |
| Frequency Stability | Un-Modulation |

Note: The EUT can only be used at Y axis position.

2.3 Far Field Boundary Calculations

The far-field boundary is given as:

far field = $(2 * L^2) / \lambda$

where:

L = Largest Antenna Dimension, including the reflector, in meters

 λ = wavelength in meters

3.1.4 Test Setup

AC Power Conducted Emissions

1—Interconnecting cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center forming a bundle 30 cm to 40 cm long.

Report No.: FR871326

- 2—The I/O cables that are not connected to an accessory shall be bundled in the center. The end of the cable may be terminated, if required, using the correct terminating impedance. The overall length shall not exceed 1 m.
- 3—EUT connected to one LISN. Unused LISN measuring port connectors shall be terminated in 50 Ω loads. LISN may be placed on top of, or immediately beneath, reference ground plane.
- 3.1—All other equipment powered from additional LISN(s).
- 3.2—A multiple-outlet strip may be used for multiple power cords of non-EUT equipment.
- 3.3—LISN at least 80 cm from nearest part of EUT chassis.
- 4—Non-EUT components of EUT system being tested.
- 5—Rear of EUT, including peripherals, shall all be aligned and flush with edge of tabletop.
- 6—Edge of tabletop shall be 40 cm removed from a vertical conducting plane that is bonded to the ground plane.
- 7—Antenna can be integral or detachable. If detachable, then the antenna shall be attached for this test.

3.1.5 Test Result of AC Power Conducted Emissions

Test Conditions see ANSI C63.10, clause 5.11

Test Setup see ANSI C63.10, clause 6.2.3

Report No.: FR871326

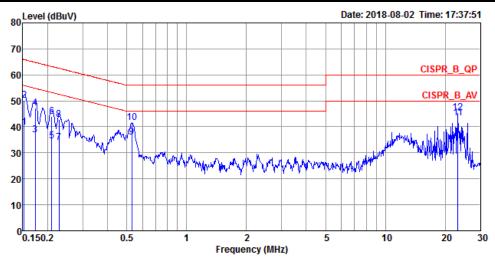

NOTE 1: If equipment having different channel plan and nominal channel bandwidth modes (see test report clause 1.1.1), the measurements are uninfluenced by different channel plan and nominal channel bandwidth modes, may not need to be repeated for all modes. If equipment having different transmit operating modes (see test report clause 1.1.2), the measurements are uninfluenced by different transmit operating modes, may not need to be repeated for all the operating modes. Similar, if the equipment supports different modulations and/or data rates, the measurements described in ANSI C63.10, clause 5.12 may not need to be repeated for all these modulations and data rates. Simple comparison of engineering test across all operating modes, modulations and data rates may need to be performed to define the worse case combination to be used for the conformance testing.

NOTE 2: ">20dB" means the tables in this clause should only list values of spurious emissions that exceed the level of 20 dB below the applicable limit, see ANSI C63.4, clause 10.1.8.1.

3.2.1 Limit of Occupied Bandwidth

| 6dBc Bandwidth (see Note 1) | None |
|-------------------------------------|------|
| 26dBc Bandwidth | None |
| 99% Occupied Bandwidth (see Note 2) | None |

Report No.: FR871326

NOTE 1: The 6dBc bandwidth is the frequency bandwidth of the signal power at the -6 dBc points when measured with a 100 kHz resolution bandwidth. These measurements shall also be performed at normal test conditions.

NOTE 2: The 99% occupied bandwidth is the frequency bandwidth of the signal power at the 99% channel power of occupied bandwidth when resolution bandwidth should be approximately 1 % to 5 % of the occupied bandwidth (OBW). These measurements shall also be performed at normal test conditions.

NOTE: If equipment having different transmit operating modes (see test report clause 1.1.2), the measurements are uninfluenced by different transmit operating modes, may not need to be repeated for all the operating modes. Similar, if the equipment supports different modulations and/or data rates, the measurements described in ANSI C63.10, clause 5.11 may not need to be repeated for all these modulations and data rates. Simple comparison of engineering test across all operating modes, modulations and data rates may need to be performed to define the worse case combination to be used for the conformance testing. Refer as ANSI C63.10, clause 15, observe and record with plotted graphs or photographs the worst-case (i.e., widest) occupied bandwidth produced by these different modulation sources.

The measured power level is converted to EIRP using the Friis equation:

For radiated emissions, calculate the field strength (E) in dBµV/meter.

 $E = 126.8 - 20\log(\lambda) + P - G$

where:

E: is the field strength of the emission at the measurement distance, in dBμV/m

P: is the power measured at the output of the test antenna, in dBm

 λ : is the wavelength of the emission under investigation [300/fMHz], in m

G: is the gain of the test antenna, in dBi For radiated emissions, calculate the EIRP (dBm). If the measurement was performed in the far field, calculate the EIRP.

EIRP = E-meas +20log(d-meas)-104.7

where:

EIRP: is the equivalent isotopically radiated power, in dBm

E-meas.: is the field strength of the emission at the measurement distance, in dBµV/m

d-meas. : is the measurement distance, in m

NOTE 1: For the applicable limit, see FCC 15.255 (c)

NOTE 2: The comparison method which replaces EUT with a signal generator is used to find the correct conversion factor between "DSO(mV)" & "Power Measured(dBm)".

Above 40GHz

A measuring distance of at 3 m shall be used for measurements at frequencies up to 15 GHz. For frequencies above 15 GHz, any suitable measuring distance may be used. The measurement distance is chosen up to far field distance, depending on the test system noise floor for detecting spurious emission signals. Then above 15 GHz shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade from spec. distance (3 m) to measurement distance. Distance extrapolation factor = 20 log (spec. distance [3 m] / measurement distance [N m]) (dB) .The measurements described in ANSI C63.10, clause 7.8.6. If the emission cannot be detected at 1 m, reduce the RBW to increase system sensitivity. Note the value. If the emission still cannot be detected, move the horn closer to the EUT, noting the distance at which a measurement is made.

3.7 Operation Restriction and Group Installation

3.7.1 Limit of Operation Restriction and Group Installation

| Item | Limit | | | |
|-----------------------|--|--|--|--|
| | Operation is not permitted for the following products: | | | |
| Operation Restriction | • Equipment used on aircraft or satellites. (Refer as FCC 15.255 (a)) | | | |
| | • Field disturbance sensors, including vehicle radar systems, unless the field | | | |
| | disturbance sensors are employed for fixed operation. (Refer as FCC | | | |
| | 15.255 (a)) | | | |
| Group Installation | Operation is not permitted for the following products: | | | |
| | External phase-locking (Refer as FCC 15.255 (h)) | | | |

Report No.: FR871326

3.7.2 Result of Operation Restriction

Manufacturer declares that EUT will not been used on aircraft or satellites. Then user manual will include a statement to caution EUT is not permitted for used on aircraft or satellites. EUT is a wireless video area network (WVAN) for the connection of consumer electronic (CE) audio and video devices.

3.7.3 Result of Group Installation

The frequency, amplitude and phase of the transmit signal are set within the EUT. There are no external phase-locking inputs or any other means of combining two or more units together to realize a beam-forming array.
